INSTALLATION

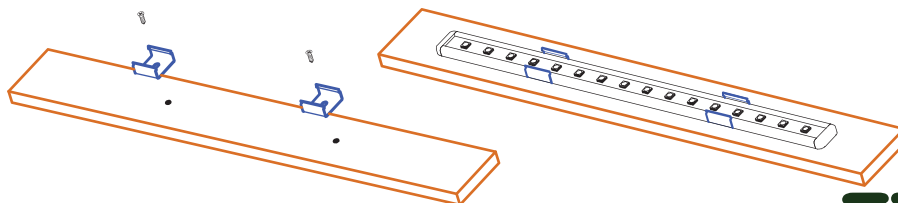

This Alumiline® MAX kit offers 12 feet of continuous LED illumination. Easy to install, it is the ideal enhancement for kitchen shelving, toe kick lighting, cove lighting and other cabinet lighting. The IP67 water-resistant rating makes it perfect for areas that get extra water spray and the low voltage makes it safe. This kit is available in Warm or Cool White.

These LED strips can be mounted in multiple configurations with the connectors and clips included in this kit. Using included screws, attach *mounting clips* (two per LED strip) to the surface above the area you'd like to have illuminated. Insert strips into clips. Connect the strips to each other using built in connectors. Take note of keeping the polarity of the wires consistent (**red to red** and **black to black**). Use the enclosed *jumpers* if you would like to provide additional spacing between the strips or if you need extra distance between the power supply and the first Alumiline® strip.

The Alumiline® MAX LED system operates on 24VDC. Use the included power supply to Connect your LED strips to the included powers supply by inserting the barrel of the power supply into the long *input connector*. Plug the *on/off* switch into the wall with the power supply and turn on the Alumiline®!
